- 1 REPORT ON SUB-SOIL INVESTIGATION
  - 1.1. INTRODUCTION AND BACK GROUND
  - 1.2. PURPOSE OF THE STUDY
  - 1.3. SCOPE OF WORKS
  - 1.4. LIMITATIONS
  - 1.5. SEISMOLOGY
- 2 INVESTIGATION PROGRAM
  - 2.1 FIELD INVESTIGATION
  - 2.2 EXECUTION OF BORINGS
  - 2.3 STANDARD PENETRATION TESTS (SPT)
  - 2.4 DISTURBED SAMPLE COLLECTION
  - 2.5 UNDISTURBED SAMPLE COLLECTION
  - 2.6 RECORDING OF GROUND WATER TABLE
  - 2.7 OTHER FIELD TESTS
  - 2.8 LABORATORY INVESTIGATION
- 3 DETAILED CALCULATIONS
  - 3.1 DETERMINATION OF BEARING CAPACITY OF SOIL FOR FOOTING
  - 3.2 DETERMINATION OF PILE CAPACITY (SINGLE PILE)
- 4 CONCLUSION & RECOMMENDATION

APPENDIX – A: SITE PLAN & BORE LOG

APPENDIX – B: LABORATORY TEST

APPENDIX – C: BEARING CAPACITY CALCULATION

## **1.1. INTRODUCTION AND BACK GROUND**

*BSO ASSOCIATES LTD* were commissioned for carrying out sub soil investigation works and geotechnical features of the following project:

Client	:	<b>Mc Grath Real Estate</b>
Name of Project	:	<b>Construction of G+9-Storied Residential Building with 1 Basement</b>
Site Location	:	<b>15/17, Santibag, Malibag, Dhaka.</b>

**DIGITAL SURVEY SOLUTION** located at Suit #21, Navana Tower,45, Gulshan South Avenue (Circle-1), Dhaka-1212 is a well-known firm & has been entrusted to engage with the geotechnical investigation work for the above-mentioned site by the concerned authority.

Technical soil data obtained from the field investigations (subsoil conditions and groundwater condition) are presented in this report along with the analyses of bearing capacity of foundations of a different range of size and depth & different laboratory test results. This report is being written to provide guidelines for foundation design.

The tests and terminologies used in this report are according to BNBC-2006, AASHTO/ASTM , ACI code and other standard codes. The site investigations generally follow accepted practices for geotechnical engineering. The format and contents are guided by the client specific needs and economics.

## **1.2. PURPOSE OF THE STUDY**

The purpose of investigation is to determine the existing soil profiles and engineering characteristics of the subsurface conditions at the site and to provide the designer with comments on the following:

- Suitable footing types, founding depths and geotechnical design parameters which will be required for a safe and economic design and excavation of the engineering works, such as the soil bearing capacity, expected foundation settlement, side slope stability, hydrological conditions at the site and other special recommendation which depends on the nature of the site.
- Methods of construction of foundation and footings, site seismicity characters, groundwater conditions, quality control requirements and outdoor subgrade and soil retaining parameters.

### **1.3. SCOPE OF WORKS**

The scope of investigation for this study comprises the following:-

- Collecting information such as geological and geotechnical maps related to the project site, public services, and land use maps.
- Making visits for site reconnaissance in order to collect information about site nature, topography of the site, geological features and other properties concerning the project site.
- Drilling boreholes and collecting soil samples from field at desired intervals for subsequent observation and laboratory testing.
- The soil investigation both in the field and laboratory were carried out in detail to evaluate the mechanical, physical and geotechnical properties of safe and economic foundation with a view to recommend the safe and economic foundation for the proposed structures to be constructed within the investigation site.
- The report contained the works program, methodology of the field and laboratory investigation works, discussions on physical and engineering properties of sub-soil formation encountered during investigation, evaluation of laboratory test data, analysis of bearing capacities, foundation recommendations and charts and graphs representing the field and laboratory test results.

The laboratory test results, analysis, discussion and recommendations which are presented in this report are valid only for the locations where the actual investigations have carried out.

### **1.4. LIMITATION**

The results provided in the report are indicative of the sub-surface conditions on the site only at the specific sampling and/or testing locations, and then only to the depths investigated and at the time the work was carried out. Sub-surface conditions can change abruptly due to variable geological processes and also as a result of human influences. Such changes may occur after GSS's field testing has been completed.

GSS's advice is based upon the conditions encountered during this investigation. The accuracy of the advice provided by GSS in this report may be affected by undetected variations in ground conditions across the site between and beyond the sampling and/or testing locations. The advice may also be limited by budget constraints imposed by others or by site accessibility.

This report, or sections from this report, should not be used as part of a specification for a project, without review and agreement by GSS. This is because this report has been written as advice and opinion rather than instructions for construction.

## 1.5. SEISMOLOGY

Bangladesh has been divided into three seismic zones with different levels of ground motion. A map of Bangladesh showing the boundaries of the three zones is provided in Appendix B. It indicates the seismic zoning map of Bangladesh. Each zone has a seismic zone coefficient (Z) which represents the maximum considered Peak Ground Acceleration (PGA) on very stiff soil/rock. The zone coefficients of the three zones are:

$$Z = 0.12 \text{ (Zone 1)}$$

$$Z = 0.20 \text{ (Zone 2)}$$

$$Z = 0.28 \text{ (Zone 3)}$$

$$Z = 0.36 \text{ (Zone 4)}$$

Fig No 1.1: Seismic Zoning Map of Bangladesh (As per BNBC 2020)

## **2. INVESTIGATION PROGRAM**

To appraise the required geotechnical parameters for foundation design of the proposed structure, the investigation program has been set into the following steps:

- i) Field Investigation works and
- ii) Laboratory Tests.

### **2.1 FIELD INVESTIGATION WORKS**

The actual field investigation work was started on 18/07/2023 and was completed on 21/07/2023.					
Number of Boring	:	05	Depth of Boring	:	18.0 m (max)
SPT Execution	:	60	Interval of SPT execution	:	1.5 m
Disturbed sample	:	60	Undisturbed Sample	:	Nil
Compaction Test	:	Nil	Water Table Level below	:	1.82 m
Permeability Tests	:	N/A	Other Tests	:	N/A

### **2.2 Execution of Borings**

The boring was conducted using 100 mm diameter casing. The method consists in first driving a casing through which a hollow drill rod with a sharp chisel or chopping bit at the lower end is inserted. Water is forced under pressure through the drill rod which is alternatively raised and dropped, and also rotated. The soil cuttings are forced upto the dropped and also rotated. The soil cuttings are forced upto the ground in the drilled rod and casing. Before taking SPT and collection of disturbed and undisturbed soil samples, the bore hole is cleaned with repeated circulation of mud slurry.

### **2.3 Standard Penetration Tests (SPT)**

The standard Penetration Tests (SPT) was performed in all the bore holes locations. Standard Penetration Test was conducted in the boreholes at intervals of 1.5 m to 3.0 m depth or at change of strata whichever is earlier using a splits spoon sampler. The split spoon sampler used is of a standard design having an outer diameter 50.8 mm and inner diameter of 35 mm.

In SPT testing, the rope-and-pulley (R-P) method would be used. This consisted of a hollow cylindrical mass sliding over a steel rod. It is operated by lifting the mass with a rope over a cat head. The tests were executed by using 63.5 kg hammer falling freely from a constant height of 760 mm. a record of the number of blows required to penetrate every 15 cms to a maximum depth of 45 cms was made. The first 15 cm of drive are considered to be seating drive and are neglected. The SPT value (N-value) was taken as the summation of blows required in 2<sup>nd</sup> and 3<sup>rd</sup> 15 cm of penetration of sampler.

On completion of a test the split spoon sampler was opened and soil specimens were preserved in polythene bags for logging purpose. The SPT values (N-values) are shown on the borehole logs against the respective interval of tests.

- The Standard Penetration Tests provide a fair knowledge on the density and consistency of the soil layer encountered and in addition yields disturbed/ semi-disturbed soil samples from within the split spoon sampler used during the tests.

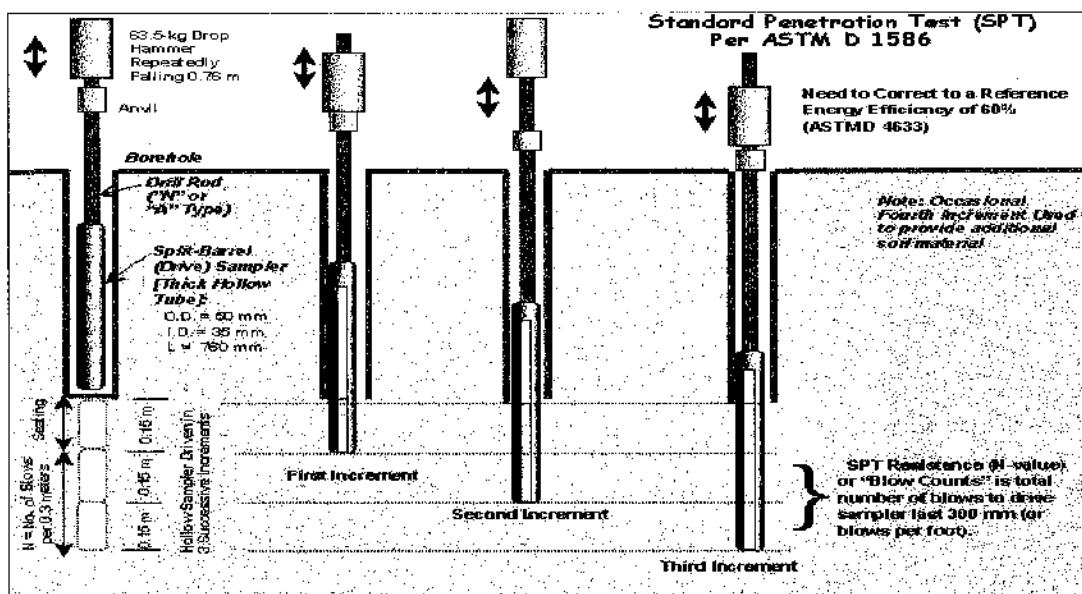

Figure for Standard Penetration Tests

## 2.4 Disturbed Sample Collection

The disturbed samples were collected with the help of split spoon sampler used during Standard Penetration Tests. The collected samples were classified in-situ and were preserved in water tight polythene bags with proper identification marks for onward transmission to the laboratory for further analysis.

The disturbed samples were also used to reconstruct depth wise stratification of bore holes depending on its classifications.

## 2.5 Undisturbed Sample Collection

The undisturbed samples were collected whenever feasible from the cohesive layers with the help of thin walled Shelby tubes 76 mm diameter thin walled Shelby tubes are penetrated into the undisturbed soil formation at the bottom of the borehole by applying rapid but continuous force. The samples recovered within the Shelby tubes were wax sealed at both ends and transmitted to the laboratory with proper identification marks.

## 2.6 Recording of Ground Water Table

Groundwater is one element that affects in the stability and foundation analyses. Groundwater affects many elements of the foundation design and construction, so that the ground water level was generally assessed from borehole during drilling. The ground water table was recorded in each of the boreholes by rope/rod sounding after 24 hours of completion of the drilling and sampling operation.

## 2.7 Other Field Tests

Any other field tests if necessary, which were conducted at site was done as per AASHTO / ASTM standard specifications.

## 2.8 LABORATORY INVESTIGATION

After classification and carrying out the geological description on the obtained samples, a laboratory tests program was issued; this program contained the required tests on selected samples in order to determine the physical and mechanical properties of the ground materials.

Grain Size Distribution	:	06	Atterberg Limits Test	:	05
Specific Gravity	:	Nil	Moisture Content	:	05
Unconfined Compression Test	:	Nil	Consolidation Test	:	Nil
Direct Shear Test	:	06	Standard Proctor Test	:	Nil
Free Swell Index	:	Nil	Chemical Test	:	Nil

Where applicable, The tests were performed according to American Society for Testing and Materials (ASTM) Standard as follow:

Table No.3: Common Soil Laboratory Tests Used in Geotechnical Engineering

Type of condition	Soil Properties	Specification
Index Test	Classification	ASTM D 2487-93
	Particle size	ASTM D 422-90
	Atterberg limits	ASTM D 4318-95
	Water (or moisture) content	ASTM D 2216-92
	Specific gravity	ASTM D 854-92
	Index Tests Sand equivalent (SE)	ASTM D 2419-95
Settlement	Consolidation	ASTM D 2435-96
	Organic content	ASTM D 2974-95
	Fill compaction: Standard Proctor	ASTM D 698-91
	Fill compaction: Modified Proctor	ASTM D 1557-91
Shear strength for slope movement	Unconfined compressive strength	ASTM D 2166-91
	Unconsolidated undrained	ASTM D 2850-95
	Consolidated undrained.	ASTM D 4767-95
	Direct shear	ASTM D 3080-90

- Other tests will be defined depending on the clients and engineer's requirement if applicable.
- The soils will be also classified based on the Unified Soil Classification System (USCS).

### 3.1 DETERMINATION OF BEARING CAPACITY OF SOIL FOR FOOTING

The SPT is widely used to obtain the allowable bearing capacity values in the following general equation for sandy soil (for Maximum 25 mm settlement)

#### A. Cohesive soil:

$$Q_u = 5.14 * C_u * (1 + 0.2 * D_f / B) * (1 + 0.2 * B / L) * B * L ; [Skempton (1951)]$$

#### B. Cohesionless soil:

i) for  $B \leq 4.0\text{ft}$

$$Q_u = (N_{corr}/2.5) * (F_d * S) * B * L ; [Bowles (1977)]$$

ii) for  $B > 4.0\text{ft}$

$$Q_u = (N_{corr}/4.0) * (F_d * S) * ((B+1)/B)^2 * B * L ; [Bowles (1977)]$$

where,

$Q_u$  = Net Ultimate Bearing Capacity (kip)

$C_u$  = Undrained Cohesion (ksf)

$N_{corr}$  = Corrected SPT for overburden pressure

$B$  = Width of foundation (ft)

$L$  = Length of foundation (ft)

$F_d$  = Depth factor =  $1 + 0.33 * (D_f / B) \leq 1.33$

$D_f$  = Depth of foundation from EGL (ft)

$S$  = Tolerable Settlement (inch)

#### ❖ Terzaghi Ultimate Bearing Capacity Theory

$$Q_u = c N_c + \gamma D N_q + 0.5 \gamma B N_\gamma$$

= Ultimate bearing capacity equation for shallow strip footings, ( $\text{kN/m}^2$ ) ( $\text{lb/ft}^2$ )

$$Q_u = 1.3 c N_c + \gamma D N_q + 0.4 \gamma B N_\gamma$$

= Ultimate bearing capacity equation for shallow square footings, ( $\text{kN/m}^2$ ) ( $\text{lb/ft}^2$ )

$$Q_u = 1.3 c N_c + \gamma D N_q + 0.3 \gamma B N_\gamma$$

= Ultimate bearing capacity equation for shallow circular footings, ( $\text{kN/m}^2$ ) ( $\text{lb/ft}^2$ )

#### ❖ Mayerhof's Equation (1963) for Bearing Capacity

$$Q_a = Q_u / F.S. = (c.N_c.s_c.d_c.i_c + 0.5.\gamma_l.B.N_r.s_r.d_r.i_r + \gamma_2.D_f.N_q.s_q.d_q.i_q)/F.S.$$

#### ❖ Hensen's Equation (1970) for Bearing Capacity

$$Q_a = Q_u / F.S. = (c.N_c.s_c.d_c.i_c.g_c.b_c + 0.5.\gamma_l.B.N_r.s_r.d_r.i_r.g_r.b_r + \gamma_2.D_f.N_q.s_q.d_q.i_q.g_q.b_q)/F.S.$$

where

$N_c = \cot\phi(N_q - 1)$ ,

$e$  = Napier's constant = 2.718...,

$N_q = e^2(3\pi/4 - \phi/2)\tan\phi / [2\cos^2(45 + \phi/2)]$ ,

$s_c, s_r, s_q$  = Shape Factors

$k_p$  = Passive pressure coefficient

$d_c, d_r, d_q$  = Depth Factors

$^2N_\gamma = (1/2) \tan\phi(k_p / \cos\phi - 1)$ ,

$i_c, i_r, i_q$  = inclination Factors

**Allowable net bearing capacity,  $Q_{all} = Q_u / (F.S.=3.0)$**

### 3.2 DETERMINATION OF PILE CAPACITY (A SINGLE PILE)

The load applied to a single pile is carried jointly by the soil beneath the tip of the pile (End Bearing) and by soil around the shaft (Skin Friction), with deducting the self-weight of the pile and the maximum load that the pile can support. The pile capacity is given by-

$$Q_{ult} = \text{Base Resistance, } Q_p + \text{Shaft Resistance, } Q_s - \text{Weight of pile}$$
$$= A_p * E_b + f_s * \pi * D * L - W_p$$

Where,

$E_b$  = end bearing capacity

$D$  = diameter of pile

$f_s$  = shaft resistance (skin friction)

$L$  = length of pile

$A_p$  = area of pile point

Design load capacity,  $Q_d = Q_{ult} / F. S.$

where, F.S. , Factor of Safety = 2.5 for all cohesive and cohesionless soil

#### 1. Ultimate Skin Friction

**Cohesive soil:**  $Q_s = \alpha * C_u * A_s$ ; [Tomlinson Formula ( $\alpha$  method)]  
where,

$Q_s$  = ultimate skin friction of pile (kip)

$\alpha$  = empirical adhesion factor or friction constant

$C_u$  = undrained cohesion [=  $N/8$  (ksf), where no data is available]

$A_s$  = circumferential area of pile (sft)

**Cohesionless soil:**  $Q_s = 0.02 * N_{corr} * A_s$ ; [Meyerhof (1976)]  
where,

$Q_s$  = ultimate skin friction of pile (kip)

$N_{corr}$  = corrected SPT for overburden pressure

$A_s$  = circumferential area of pile (sft)

#### 2. Ultimate End Bearing Capacity

**Cohesive soil:**  $Q_p = 9 * C_u * A_p$ ; [Skempton's Formula]  
where,

$Q_p$  = ultimate end bearing capacity of pile (kip)

$C_u$  = undrained cohesion [=  $N/8$  (ksf), where no data is available]

$A_p$  = tip area of pile (sft)

**Cohesionless soil:**  $Q_p = 2.66 * N_{corr} * A_p$ ; [Meyerhof (1976)]  
where,

$Q_p$  = ultimate end bearing capacity of pile (kip)

$N_{corr}$  = corrected SPT for overburden pressure

$A_p$  = tip area of pile (sft)

#### **4. CONCLUSION & RECOMMENDATIONS**

The Recommendations submitted in this report are prepared on the basis of obtained field SPT & available subsurface Samples from field and subsequent laboratory tests for the exclusive use of the project mentioned below:

<b>Client</b>	<b>:</b>	<b>Mc Grath Real Estate</b>
<b>Name of Project</b>	<b>:</b>	<b>Construction of G+9-Storied Residential Building with 1 Basement</b>
<b>Site Location</b>	<b>:</b>	<b>15/17, Santibag, Malibag, Dhaka.</b>

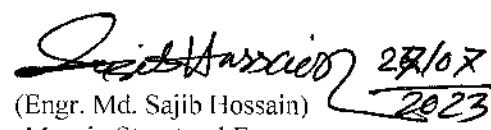

- The sub-soil formation encountered at the proposed site is almost homogeneous and the degree of disintegration varies slightly at places. The sequence of lithological composition as well as consistency of the soil at different depths has been depicted in the respective bore logs BH-1 Through to BH-05 in Appendix A.
- RCC Cast-in-situ piles may be installed below the foundation. **Determining effective length of a pile segment requires engineering judgment.** The Allowable Load Bearing Capacity (Ton) of **20-inch Dia** RCC Cast-in-situ pile for different depth is given below.

Pile Size, inch	Depth From EGL, (ft)	Allowable Load Bearing Capacity (Ton) Considering Factor of Safety = 2.5				
		BH-01	BH-02	BH-03	BH-04	BH-05
	55	99.03	101.48	100.35	103.61	106.10
<b>20" Cast-in situ</b>	60	99.92	102.31	101.21	104.51	106.95

- Soil parameters for foundation design as well as the allowable bearing capacity of soil for shallow and deep foundation is provided in appendices.
  - **Table 1. for shallow foundation design.**
  - **Table 3. for Mat Foundation**
  - **Table 2.1 to Table 3.5 for RCC cast-in-situ pile capacity for different depth & dimensions.**
  - Linear Interpolation is acceptable for intermediate values of these capacities.
  - Laboratories test are enclosed in Appendix B.
- **Bearing Capacity should be confirmed by plate Load Test for shallow foundation or Pile Load Test for Deep Foundation.**
- Moreover considering the magnitude of the structure, column spacing & environmental condition and location of the proposed site, the foundation engineer will put his judgment and experience to select the suitable alternative type & depth of foundation.

The material contained in this report reflects our best judgment in the light of the information available through site visit, field investigation, laboratory test and subsequent calculations.
